CCTV False Alarm Reduction Software

Our artificial intelligence (AI) filter package analyses live CCTV streams and alerts ARC operators upon human activity only. The system also uses smart phone 'Push' technology to send alert notifications instantly. After significant testing on troublesome sites, the platform has processed thousands of triggers. The AI software has proved very successful, identifying individuals and avoiding familiar false activation problems such as plant movement, wildlife, sun and rain.

The AI processors only require a very low bandwidth stream for analysis. Typically 0.1 to 0.2 Mbps. All data is securely viewed by our SIA accredited CCTV staff.

Service Includes:

• Single camera with inbuilt recording via SD card (Optional Cloud backup* 3,7,14 or 30 days)

• False Alarm Activation Software to filter false activations

• Professional monitoring 24/7**

• Smart App to view alarm notifications and live stream video from CCTV cameras monitored through the software

Benefits Include:

• Available for open and temporary sites

• Easy to install – no NVR, no CCTV engineer required

• Smartphone App on Android and IOS architectures (App available FOC on relevant stores)

• Reduce problems caused from runaway cameras

• Negate unnecessary keyholder contact through false activations

• Use as a temporary fix for a short, mid or long term issue such as plant growth

Please contact us if you have an existing system that you would like to integrate with our software.

*   Multi camera systems also available
** Excessive activations apply
